

A PLAIN-LANGUAGE GUIDE

ContractLens

Enterprise

What it is, how it works and why you can trust it.
Written for people who use contracts, not code.

ContractLens assists professionals. It does not give legal advice.

What is ContractLens?

ContractLens is a desktop program that **reads your contracts for you and keeps track of what they promise**: who has to do what, by when, and what happens if a date is missed. It then reminds the right people at the right time.

The problem it solves

Contracts hide important things in long paragraphs: a renewal that happens automatically unless you give notice 60 days ahead, a payment due 30 days after an invoice, a service promise with penalties. Miss one date and a contract can silently renew for another year, or a penalty can be lost. People miss them because nobody can re-read every contract every week.

What it does for you

- **Reads** contracts you upload (PDF or Word, including scanned pages).
- **Pulls out** the key facts: parties, start and end dates, renewal terms, payment terms, termination rules, obligations.
- **Works out the deadlines** with a calculator, not a guess, and shows its working.
- **Warns you** about renewals, overdue duties and things that look risky.
- **Answers questions** in plain English, and always shows the exact passage it used.
- **Keeps a record** of who confirmed what, so decisions can be traced later.

What it is not

It is not a lawyer and does not decide whether a contract is valid or safe to sign. It points out things worth a human's attention. Nothing important happens until a person says yes.

Who it is for

Team	How they use it
Legal	See every commitment and unusual clause in one place, with the original wording one click away.
Procurement	Never miss a renewal window or a chance to renegotiate; compare a contract with its amendments.
Finance	Know payment terms, price changes and notice dates before they bite.
Compliance & operations	Assign each obligation an owner, track it to completion, and keep proof.

HOW IT WORKS

From a file to a decision, in five steps

Think of ContractLens as a careful assistant who reads the contract, highlights every claim with a quote, double-checks its own work, and then hands the final call to you.

Step	What happens	In everyday terms
1 Upload	You drag a file into the app. It checks the file is safe and is not a duplicate.	Handing a document to your assistant.
2 Read	The text is extracted page by page. If a page is just a picture, a text-recognition tool (OCR) reads it.	Reading, including squinting at scans.
3 Understand	A team of AI specialists identifies parties, clauses, obligations, dates, amendments and risks.	Highlighting and note-taking.
4 Check	Each fact must come with a word-for-word quote found in the contract. A separate checker rejects anything it cannot find. Dates are then computed by ordinary code.	A second person proof-reading, plus a calculator.
5 You decide	Everything starts as "pending review". You confirm, correct or reject. Only then does it count.	Your signature on the summary.

Example

A contract says: *"Either party may end this agreement by giving 60 days' written notice before the end of the term."* ContractLens records the quote, notes the term ends on 14 Jan 2027, calculates that notice must be sent by 15 Nov 2026, shows the arithmetic, and waits for you to confirm. Two months out it starts reminding you.

Why dates come from a calculator, not from the AI

AI is excellent at reading but can be wrong at arithmetic and can sound confident when it is unsure. So the AI only **finds** the wording ("60 days before the end of the term"). A fixed, testable calculator does the counting, including weekends and holidays you have configured, and records every step so you can check it.

The screens, one by one

The menu on the left has one entry per job. Everything below is real output from the built-in demo data (three sample contracts).

Command Center: your morning overview

Numbers that matter today: active contracts, renewals coming up, open and overdue obligations, items waiting for a human, plus charts and an alert list.

Command Center. Click any tile to jump to the matching list.

Contract Intelligence: the contract library

Every contract appears as a card with its status, parties, expiry date and a **review score** ring. A higher score means more that deserves a person's attention, not a “bad contract”.

Contract list. The colored stripe shows status; the ring shows the review score.

Open a contract to see the **workspace**: key terms as tiles, the original text with search, a clause list on the left, and AI insights, obligations, deadlines, versions and an “Ask” chat on the right.

Contract workspace: key terms, clause explorer, document viewer and AI insights side by side.

Obligation Operations: who owes what

Every duty in every contract, in one list. The tiles on top act as filters. Select a line to see who is responsible, when it is due, the quote it came from, and notes. **Only a person can mark an obligation complete, and must record the evidence.**

Obligation list with a selected obligation on the right.

Renewal Radar: never miss a notice date

Shows what is coming up, the last day to give notice, and how each date was calculated. If a contract renews automatically the app states its assumptions plainly. You can confirm, override or handle each deadline, and export confirmed ones to your calendar.

Renewal Radar with calculated notice dates.

Risk Observatory: where to look first

A heat-map of signals across contracts, with two separate scores. **Business review score** says how much attention a contract deserves. **Extraction uncertainty** says how much of the AI's reading still needs checking. They are kept apart on purpose: an uncertain reading is not the same as a risky contract.

Risk Observatory: matrix, heat-map and trend.

Evidence Explorer: proof on demand

Search across contracts and see the exact verified quotes behind every fact. Search matches meaning as well as words, and never mixes one company's documents with another's.

AI Copilot: ask in plain English

Type a question such as “Which contracts expire in the next 90 days?”. The answer shows its sources and any uncertainty. If the contracts do not contain the answer, it says so instead of guessing.

Copilot answering a question from stored records, with the type of answer labelled.

Also in the menu

Screen	What it is for
Agent Runs	A look behind the scenes: which AI specialist did what, how long it took and any warnings.
Integrations	Export confirmed deadlines to a calendar file, or send notifications to another system (only to addresses you have approved).
Administration	Team members and roles, alert timing, holidays, deletion rules and the audit log of every important action.

The AI team

Instead of one AI doing everything, ContractLens uses a small team of specialists, each with one narrow job, coordinated by a manager. Narrow jobs are easier to check.

Specialist	Like a...	Its one job
Supervisor	Project manager	Decides the order of work, retries failures, and sends weak results to a human.
Document Intelligence	Records clerk	Turns the file into clean, page-numbered text.
Contract Extraction	Paralegal	Finds parties, dates, clauses and key terms.
Obligation Intelligence	Compliance officer	Lists who must do what, and under which conditions.
Temporal Reasoning	Calendar keeper	Turns wording like "30 days after invoice" into a real date, using the calculator.
Amendment Intelligence	Version reviewer	Compares versions and amendments; changes apply only after a person approves.
Risk Triage	Risk analyst	Flags unusual or missing terms and scores how much review is needed.
Evidence QA	Quality auditor	Rejects any fact whose quote cannot be found in the contract.
Grounded Copilot	Research assistant	Answers your questions, only from your contracts, with sources.

Where everything lives

Supabase is the online database and login system. Security rules there make sure each company can only ever see its own data. **The search index** lets the app find the right paragraph instantly. **OpenAI** supplies the reading ability. The app can also run in a **demo mode** with nothing online at all.

Why you can trust the results

Contract mistakes are expensive, so the system is built around one idea: **nothing is believed just because an AI said it.**

Safeguard	What it means for you
Every fact has a quote	Each extracted fact links to the exact sentence and page. Click it and the document opens on that spot.
Fabrications are caught	A quote that does not appear word for word in the contract is rejected. The demo includes a deliberately invented obligation so you can watch this happen.
Humans decide	Deadlines start as “pending review”. Obligations are completed only by a person who records the proof. Amendments apply only after approval.
Honest about doubt	Where wording is vague, it says so and lowers its confidence instead of picking an answer. The Copilot refuses questions the text cannot answer.
Dates are calculated	A deterministic calculator with visible working, not an AI opinion.
Companies stay separate	Database rules enforce that one organisation can never read another's contracts, even if the app itself had a bug.
Roles and limits	Owners, admins, editors and viewers have different rights. Viewers cannot change anything.
Everything is logged	An audit log records who did what and when, for accountability.
Keys stay safe	The desktop app uses only the low-privilege public key. The powerful “service” key is deliberately refused.

Not legal advice

Scores and flags are prompts for review. They are not conclusions about whether a contract is valid, enforceable or compliant. Always involve a qualified professional for legal decisions.

GETTING STARTED

Trying it and setting it up

Try it in five minutes (demo mode)

- Open the app and click **Enter demo workspace**, then **Load demo data**.
- Three sample contracts, their obligations, deadlines and alerts appear. Nothing goes online.
- In demo mode the AI step uses prepared results so you can see the full experience without an account. Your own new uploads are indexed and searchable but not analysed.

For real use, you need three accounts

Service	What it is for	Note
Supabase	Stores contracts and logins, keeps companies separate.	Free tier is enough to start.
OpenAI	Reads the contracts and answers questions.	Pay-as-you-go. Needs credits on the account, otherwise the app tells you the balance is empty.
Tesseract (optional)	Reads scanned, image-only pages.	Free program installed on the computer.

A technical colleague fills in a settings file once (keys and web addresses). The step-by-step instructions are in the project's deployment document.

Current status, honestly

Item	Status
Demo mode, all screens, calculations, checks	Built and covered by automated tests (all passing).
Live Supabase and live OpenAI connections	Configured but not yet exercised end to end in testing. Recommended before relying on it.
Scanned pages (OCR)	Working; needs Tesseract installed.
Local search index	Working. Teams should use a shared search server.
Updates on screen	Refreshes by checking periodically rather than instantly.

Glossary and common questions

Term	Plain meaning
Obligation	Something a party has promised to do, such as paying an invoice or giving notice.
Deadline	The date an obligation is due, calculated from the contract wording.
Auto-renewal	The contract continues by itself unless someone gives notice in time.
Notice period	How far ahead you must warn the other side before ending or changing a contract.
Amendment	A later document that changes an earlier contract.
Evidence / quote	The exact sentence in the contract that supports a fact.
OCR	Text recognition that reads words from a picture of a page.
Agent	One AI specialist with a single narrow job.
Review queue	Items waiting for a person to confirm or reject.
Extraction uncertainty	How much of the AI's reading still needs human checking.
Business review score	How much human attention a contract deserves. Not a legal verdict.
Audit log	A permanent record of who did what and when.
Demo mode	A safe practice mode with sample contracts and no online connection.

Common questions

Does it replace our lawyers?

No. It saves them time by finding and organising, and points them to the exact wording.

Can the AI make things up?

It can try, which is why every fact must be backed by a quote that is verified against the contract. Unverifiable facts are rejected or marked for review.

Who can see our contracts?

Only people in your organisation, with the role you give them. The database itself enforces this.

What leaves our computer?

The text passages the AI needs in order to read and answer are sent to OpenAI. Demo mode sends nothing.

What if a contract changes?

Upload the amendment as a new version. ContractLens shows what changed and applies it only after you approve.

What happens when I complete an obligation?

You must describe the evidence (for example an invoice number). It is recorded with your name and the time.
